

Emergency Medical Procedures

Emergency medical services are critical for saving lives during accidents, cardiac events, and severe illnesses.

Cardiac Emergency Protocol:

In cases of cardiac arrest, immediate CPR and defibrillation must be performed. Emergency medications should be administered as per protocol.

Trauma Care:

Trauma patients require rapid assessment using airway, breathing, and circulation checks. Severe bleeding must be controlled immediately.

Stroke Management:

Patients showing signs of stroke must receive urgent medical evaluation. Timely imaging and thrombolytic therapy can significantly improve outcomes.

Burn Management:

Burn injuries are treated based on severity. First-degree burns require basic care, while severe burns need specialized treatment and monitoring.
